going to the coil/plug and 2 red wires going to the rectifier. I think the blue wire goes to the run terminal, the black wire to the m/mag. terminal. I don't know what terminals the red/rectifier wires go to. The wiring diagrams I see only have 1 wire coming from the rectifier. Your help would be appreciated.

Identify the positive power lead to the ignition switch. The power lead is usually a thick red wire and stays energized at all times. Install the correct terminal end on the power lead wire and crimp it securely with a terminal multi-tool. Connect the power lead from the battery to the "BATT" terminal of the switch.

### **How to Wire an Ignition Switch | It Still Runs**

There are three main components in the switch starting circuit: ignition switch, starter solenoid, starter relay. 1. Ignition Switch. Usually, the ignition switch connects with a key or a button, and inside of it has the regular wire connects to the car battery. When the ignition switch is turned or pressed the button to start position, there will be a small current flow through the starter solenoid coil, allow sufficient current flow to the starter.

The solenoid, a small cylinder attached to the side of the starter, is a switch designed to handle heavy electric loads. If the starter does nothing when the start switch is on, it's likely due to a bad solenoid. The starter has three ways it can fail: — A worn out starter gear will make a grinding noise when the starter is being used.
